

Quze — Debug Mode (Web)

On-screen debug console for troubleshooting

How debug is enabled

Debug mode on the web app is controlled by a **URL query parameter**, not a separate build flag.

In `main.dart`, debug is enabled when:

```
kIsWeb && Uri.base.queryParameters['debug']?.toLowerCase() == 'true'
```

That turns on an on-screen **Debug console** overlay (logs, errors, `print()` output).

URL to send / open

Same app URL as before, with `?debug=true`:

Setup	URL
HTTP (LAN)	<code>http://YOUR_PC_IP:8080/?debug=true</code>
HTTPS (LAN)	<code>https://YOUR_PC_IP:8080/?debug=true</code>
Production	<code>https://yourdomain.com/?debug=true</code>

Examples:

- `http://192.168.2.10:8080/?debug=true`
- `http://192.168.2.10:8080/login?debug=true` (also works if you land on login)

Database Info API URL is unchanged — still e.g. `http://YOUR_PC_IP:8080/api` on first use.

How to run it locally

Step	Command / action
Backend	<code>python backend_fastapi/start_server.py</code> (port 8000)
Web app	Serve <code>build/web</code> on port 8080, or <code>flutter run -d chrome --web-port=8080</code>

Open	<code>http://YOUR_PC_IP:8080/?debug=true</code> (PC or phone)
------	---

During development

```
cd team_results_notification
flutter run -d chrome --web-port=8080
```

Then in the browser add `?debug=true` to the address bar (e.g. `http://localhost:8080/?debug=true`).

Notes

Topic	Detail
Web only	<code>debug=true</code> has no effect on Android/iOS native builds.
Installed PWA	Home-screen icon usually opens without <code>?debug=true</code> (manifest <code>start_url</code> is <code>.</code>). For debug, open the browser link with <code>?debug=true</code> each time.
Not Flutter “Debug” banner	<code>debugShowCheckedModeBanner</code> is off; you get the custom overlay in the bottom-right instead.
Normal players	Use release build without <code>?debug=true</code> .
Troubleshooting	Use <code>?debug=true</code> only when diagnosing issues.

Quick test link (replace IP)

1. Open: `http://192.168.2.10:8080/?debug=true`
2. Set API in **Database Info** → Save
3. Log in
4. Debug panel should appear on screen
